

Selection of Day-Roost Habitat by Flammulated Owls

Eve Karowe

Colorado College

Department of Organismal Biology and Ecology

Habitat Selection

- Selection of habitats that maximize fitness
- Spatial Scales
 - First-order: Geographic range
 - Second-order: Home range
 - Third-order: Microhabitats for specific activities
 - Fourth-order: Specific resource item
- Patterns vary depending on scale
- Guide habitat management strategies
 - Sensitive Species

Flammulated Owls (*Psilosops flammeolus*)

- Small, migratory, insectivorous raptor
 - Breeds in Western North America
- Old-growth Ponderosa Pine (*Pinus ponderosa*) forests
 - Frequent low-intensity fires -> Frequent high-intensity fires
- Nesting and Hunting habitat selection well-documented

of Isabel DeVito

Day-Roost Selection

- Third-order habitat selection
- Sleeping location
- Reduce metabolic costs
 - Stable thermal environment
 - Shields against wind and precipitation
- Reduce Predation
 - Camouflage
 - Hides animal from view
- Impacts of old-growth forest loss

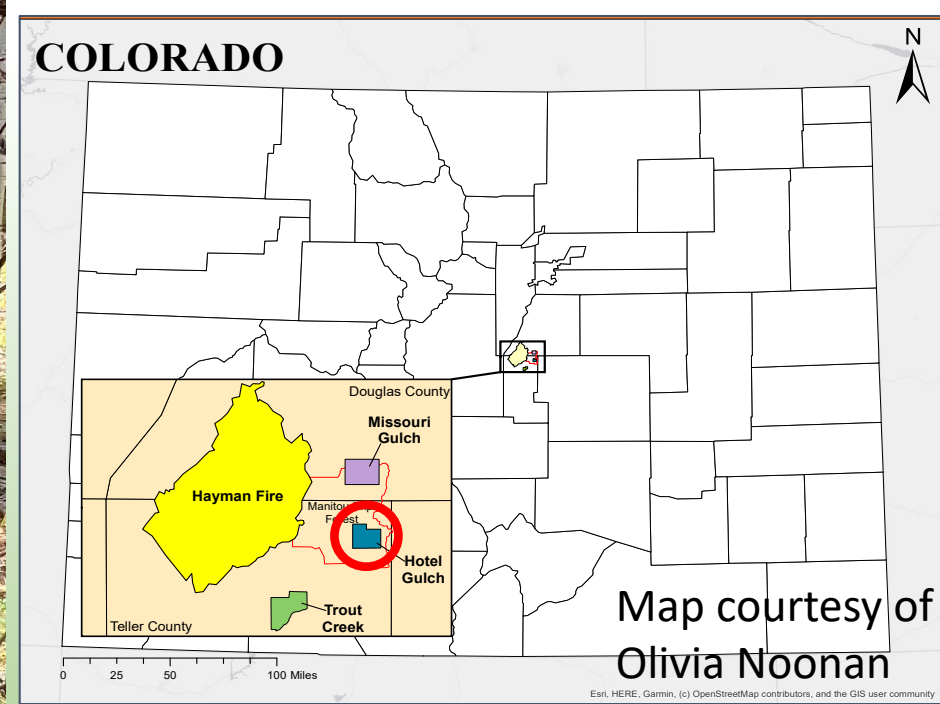

Research Questions and Hypotheses

- What characteristics do flammulated owls look for when selecting day-roosts?
- Are characteristics of old-growth forests as important for day-roost habitat as they are for nesting and hunting habitat?
- Stand Scale
 - Old stands, Ponderosa Pine/Douglas Fir, Dense trees
- Tree Scale
 - Large DBH, Ponderosa Pine/Douglas Fir, Large crown volume
- Perch Scale

Study Area

- Manitou Experimental Forest
 - Hotel Gulch Study Area
- July and October 2023

Radio Telemetry

- Radio transmitter backpacks
 - Signal picked up by antenna
 - 3 units: 2 grams each
- Tracked between July 6th 2023 and July 24th 2023

Data

Stand	Tree
Tree Density	DBH
Slope Direction	Species
Distance- Nest	Crown Volume
#Trees- Clump	

- Compared used and available sites
- Combined data sets
 - 1980s + 2023
- Logistic Regression
 - Significant traits
- Model Selection
 - Akaike

Habitat Selection: Stand Scale

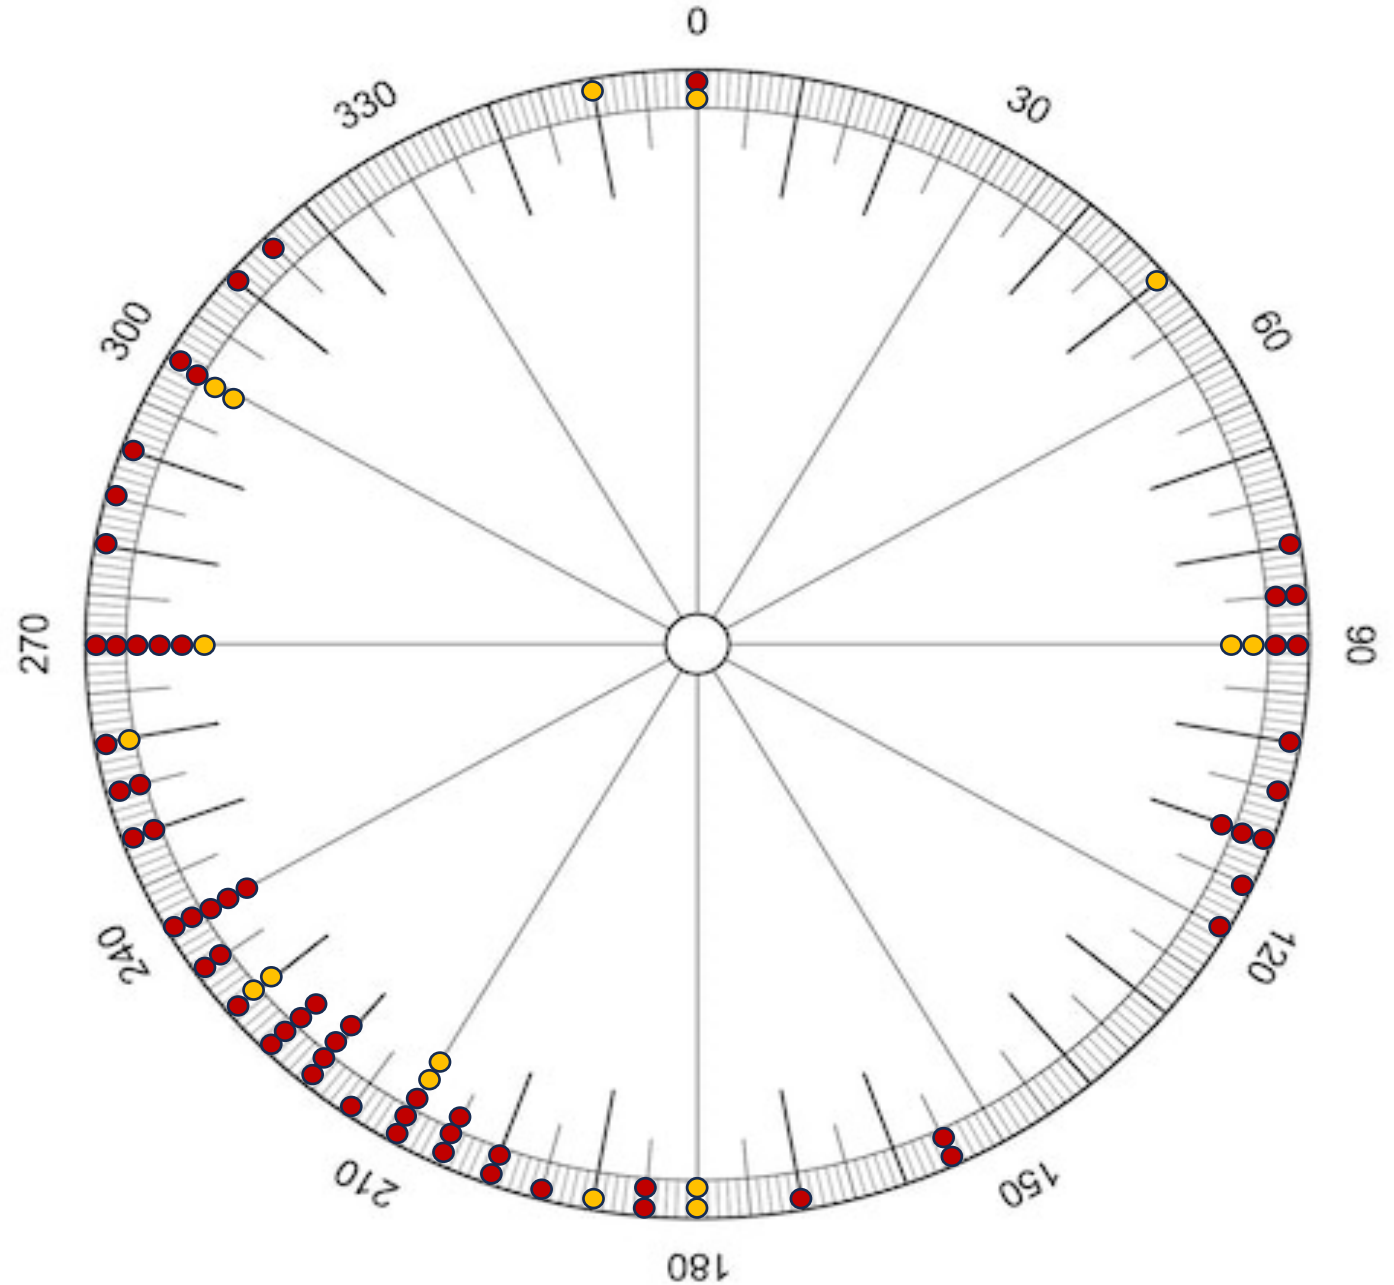

Model	Δ AIC
Slope Direction, Distance, Large Tree Density	20.20051
Slope Direction, Distance, Large Tree Density, Number of Trees in Clump	17.66452
Slope Direction, Distance	14.69017

Slope Direction

● = Used Sites

● = Available Sites

North

18%

31.3%

South

70.5%

50%

Habitat Selection: Tree Scale

Model	Δ AIC
DBH, Crown Volume	27.3352
Crown Volume	27.2481
Species, Crown Volume	27.1047

Crown Volume

DBH

Species Makeup

Available Species

- Ponderosa Pine
- Douglas Fir
- Limber Pine
- Blue Spruce
- Quaking Aspen

Used Species

Stand Scale

- Close to nest
 - 86 m
- High density of large trees
- Tree Clumps
 - Many interlocking crowns
- South-facing slopes
 - High sun exposure
 - Warm
 - Open Stands

} High amount
of cover

- Shifting Fire Regimes
 - Alter Clump Dynamics
- Increased risk of predation

Discussion

Discussion

Tree Scale

- Larger trees (DBH)
- High crown volume
- Conifers
 - Large amount of cover
- Loss of old-growth forest
 - Increase metabolic costs
 - Increase risk of predation
 - Negatively impact flammulated owl populations

Future Directions

- Temperature
 - Warming vs Cooling
 - Climate change
- Development of conservation strategies
